

ETView Option: video feedback for intubation

RespiTrainer® Advance Multi-skill Ventilation and Airway Management

If your students or staff were less than adequately trained in ventilation and intubation, how would you know? RespiTrainer puts you inside your patient's airway and lungs. Instant feedback on delivered ventilation is then sent wirelessly to your computer.

RespiTrainer software not only offers feedback for training, but can provide exportable records for competency testing as well. The adjustable lung enables hands-on experience with different patient lung conditions to prepare for a wide range of real life scenarios.

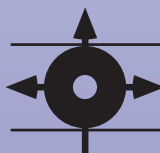

The RespiTrainer Advance training head offers unparalleled airway realism for LMA and ET-tube insertion training. Features include anatomically correct airway with visually accurate features, an inflatable tongue to increase difficulty of airway, break-out teeth and "real-feel" skin covering for practicing proper mask placement.

With the RespiTrainer Advance, you get the features of a high-end respiratory manikin at a fraction of the cost. Easy set-up for both instructor and student lets you start training and testing right away.

Related Products

ETView – See exactly what the student sees during intubation training. A tiny digital camera at the tip of the ET-tube transmits video images of RespiTrainer Advance's airways. Optimize group training with screen projections or create your own training videos.

RespiTrainer Basic – Equipped with a full face training head for bag-mask ventilation only (no intubation). Get the benefit of RespiTrainer performance feedback at a lower cost.

ETView image on the monitor helps the instructor coach and assess intubation technique.

RespiTrainer Infant can also be used with ETView
